Value Proposition

For beginner artists and hobbyists who feel stuck or fear judgment, **Draw Companion** provides a gentle, reflective companionship that helps them **find inspiration** and **track their own progress** to grow with confidence.

Problem overview

The Problem

- Based on our interviews, the biggest barrier for beginners is **emotional**, not just technical.
- **Key Pain Points:**
 - **Fear of Failure:** Beginners have a "fear of failure, not being good enough" and are often "too careful".
 - **Lack of Safe Feedback:** They need "honest but encouraging" feedback, not harsh evaluation.
 - **Feeling "Stuck":** Beginners often "don't know what to practice next" and need a way to "find inspiration easily".
 - **Lack of Motivation:** They need to see their own "visible progress" to stay motivated.

Solution overview

Our Solution

- We are designing **Draw Companion**, a "Reflective Drawing Companion" app.
- It's designed to support the emotional side of learning to draw by focusing on **personal reflection, AI-driven feedback, and private progress tracking**.
- This approach directly addresses the key user needs for safe feedback, inspiration, and motivation that we discovered in our research.

Tasks

Simple Task: Upload a drawing.

Moderate Task: Find inspiration for a new drawing.

Complex Task: Revisit older drawings of the same type to notice progress and stay motivated.

Storyboard

Tasks and storyboard

Reflecting on the Storyboard

Why did we come up with this solution ?

We think that any tool that aims to introduce new skill-set needs to be intuitive and easy to use without too many distractions. By considering all the needs we identified, we chose three main tasks that would follow each other naturally.

Strengths and weaknesses?

The current flow serves as an easy tool to be used by newbies or hobbyists. It allows user to track their progress with few steps and receive personalized feedbacks. It doesn't provide real-time personalized feedbacks during the painting process.

Does it achieve the identified goal/user needs?

The current flow touches the vital points that we've found. The covered needs are; Struggling to find Inspiration, Progress Tracking, Need for Feedback.

Tasks and storyboard

Modalities Exploration

We explored several modalities to determine the best fit for our users' needs of privacy, reflection, and ease-of-use.

- **Desktop/Web Application**
- **Smartwatch**
- **Augmented/Virtual Reality (AR/VR)**
- ***Mobile Application***
- ***Tablet Application***

Modalities exploration

Modalities Exploration

Desktop / Web Application:

- **What it is:** A website-based version of "Draw Companion" (accessed via a browser).
- **Why we rejected it:** While a web app can access the camera on a mobile browser, it creates a worse user experience compared to a native app.
 - **More Friction:** It requires users to open a browser, find the URL, and log in. Every extra step is a barrier that would discourage use, especially for our users who already feel unmotivated.
 - **Poorer Integration:** A native app integrates *seamlessly* with the device's camera and photo library. A web app's access is less reliable and feels less integrated, breaking the smooth flow required for our Simple Task (Upload a drawing).
 - **Performance:** Native apps are generally faster and more responsive, which is critical for a smooth, reflective experience.

Modalities exploration

Modalities Exploration

Smartwatch:

- **What it is:** A companion app for a wearable device.
- **Why we rejected it:** The screen is far too small. It would be impossible for a user to complete our Moderate Task (Find inspiration) or Complex Task (Revisit progress) in a meaningful way.

Augmented/Virtual Reality (AR/VR):

- **What it is:** An immersive headset experience for drawing or reflection.
- **Why we rejected it:** This technology is complex and does not align with our core solution. Our users need a *simple, private, accessible* tool, not an immersive technical drawing aid.

Modalities exploration

Selected Modalities

Mobile Phone (Primary Modality)

- **Motivation:** We chose the mobile phone for its ease of access at any time and hardware integration. Our Simple Task (Upload a drawing) requires a camera. The mobile phone is the only modality that is always with the user, allowing them to instantly capture their artwork the moment they finish it. This seamless, "in-the-moment" capture is critical for building a consistent reflective journal. Also, having a native application instead of using web application in mobile is critical for our usage of camera which works better in a native application.

Selected Modalities

. Tablet (Secondary Modality)

- **Motivation:** We selected the tablet because it already has the capabilities that we need in a mobile phone such as camera which we need for our Simple Task (Upload a drawing) and also its large screen is purpose-built for visual tasks. This is crucial for our Moderate Task (Find inspiration) and Complex Task (Revisit Progress). The larger format allows users to see their artwork in high detail and compare past work side-by-side, which is essential for "noticing progress and staying motivated."

Connection with the tasks and storyboard

- By putting only three interaction sections to the Home Page, we aimed to attract the focus of the user to the core needs.
- By making the design of the UI simple and easy to go through, we aimed to make the usage of the app frictionless for the average user.

Connection with the tasks and storyboard

- By putting only three interaction sections to the Home Page, we aimed to attract the focus of the user to the core needs.
- By making the design of the UI simple and easy to go through, we aimed to make the usage of the app frictionless for the average user.
- With the file upload flow we are handling the simple task.
- With the inspiration flow we are focusing on the moderate task
- With the progress tracking part we are targeting the complex task
