

Protocol&Script

1) Participants: selection & recruitment

Target users

- Beginner and hobbyist artists
- They should be comfortable using a smartphone or laptop
- 4 participants are needed

2) Roles during each test session

Each session will have **one facilitator** and **an observer**.

- **Facilitator:** guides the session, reads tasks.
- **Observer:** notes errors, wrong clicks, confusion moments, comments, time, success level, and general behavior. Takes photos.

3) Success criteria and metrics

Participants complete 3 tasks on the prototype. The observer logs timing, errors, wrong clicks, and success level. After each task, participants answer **SEQ**. At the end, they answer **SUS** and debrief questions.

A) Quantitative metrics (per task)

- **Time on task (seconds):** Time needed to finish the task
- **Task success (4 levels):** Each task outcome is classified as:
 - 3 - Complete success: finishes the task correctly, independently, no major problems.
 - 2 - Success with minor issue: finishes correctly, but with small mistakes or inefficiency (recovers without direct help)
 - 1 - Success with major issue: finishes only with help, or finishes but with an important mistake (wrong outcome)

- 0 - Failure: cannot finish or gives up.
- **Number of errors**
 - **Major error:** prevents completing the task correctly, or requires help to finish.
 - **Minor error:** participant recovers and completes, but with confusion or extra steps.
- **Number of wrong clicks (mis-clicks):** Count taps/clicks that do not help progress toward the task goal (for example opening the wrong section, pressing the wrong button).

B) Subjective + qualitative metrics

- **SEQ (after each task):** Overall, how easy or difficult was this task to complete?
Scale: 1 (Very difficult) - 7 (Very easy)
- **SUS (end of test):** Usability questionnaire
- **Likes / dislikes / recommendations (end):** Short open questions about what was clear and what was not
- **Background profile (pre-test):** Drawing level, drawing frequency, and whether they use drawing apps.

4) Questionnaires

5) Materials & setup

- Smartphone (or laptop)
- Prototype opened on screen
- Consent form (signed)
- Observer note sheet
- SEQ form or SUS form

6) Session Script

A) Welcome & introduction (2 minutes)

Hi, thanks for coming. I'm [NAME], and I'll guide you through this session.

We're testing a prototype of an app we designed. It's not a finished product, so some parts might be incomplete or simplified.

The important thing: **we are testing the app, not you.**

So if something feels confusing, that's useful feedback for us.

I'll ask you to complete three short tasks. The whole session should take around 20 minutes.

B) Consent

Before we start, I'll ask you to read and sign this consent form.

If you agree, we may take a couple of photos during the session for our course report. If you don't want that, totally fine.

C) Pre-test questions

Before using the prototype, I'll ask a few quick questions.

1. Do you draw? If yes, how often?
2. How would you describe your level: beginner, hobbyist, or more advanced?
3. Have you used any drawing or creativity apps before? Which ones?
4. When you draw, what's usually hardest: getting started, staying motivated, or improving?

D) Explain methodology

We conducted a moderated usability test with one participant at a time. One team member acted as the facilitator, who read the tasks and followed a predefined

script, while another team member acted as the observer, taking notes on user behavior, comments, errors, and time on task.

Participants were asked to complete a set of predefined tasks using the prototype, without receiving help or guidance, in order to observe how they naturally interacted with the system.

After each task, participants completed the Single Ease Question (SEQ) to rate task difficulty. At the end of the session, they completed the System Usability Scale (SUS) questionnaire to evaluate overall usability.

This methodology allowed us to collect both quantitative data (task success, time on task, questionnaire scores) and qualitative data (observations and user feedback).

E) First screen impression

Before you tap anything, please look at this first screen and tell me what you think this app is for.

F) Tasks

During tasks

- Do not guide them.
- If they ask what should I click, say do what you would normally do.
- If they are stuck for too long (~2 minutes), ask what do you think you would try next?
- After each task, say: Okay, thanks. Please answer this one quick question and provide the SEQ form

Task 1 (Upload a drawing)

Task 1: Imagine you just finished a drawing and you want to save it in the app.

Using the app, upload a drawing of yours using any method you prefer: taking a picture or selecting from your camera roll.

Task 2 (Find inspiration)

Task 2: Imagine you want to draw something new today, but you don't know what to draw.

Find an inspiration in the Nature category that matches your experience level, and choose one you would use.

Task 3 (Progress + feedback)

Task 3: Imagine you want to check whether you are improving over time.

Go to your older drawings, compare them, and get feedback about your progress.

G) End of test (Debrief)

Great, that was the last task. Now I'll ask a few final questions.

1. What part of the app felt the most clear?
2. What part felt confusing or annoying?
3. Did the progress and feedback feature feel motivating or stressful?
4. If you could change one thing, what would it be?
5. Would you personally use something like this? Why or why not?

H) SUS form

Thanks. Finally, please fill in this short usability questionnaire.

I) Closing

Thank you, that was very helpful. Your feedback will be used only for our HCI course project.

If you have any questions for us, feel free to ask.
